GENERAL EARTHWORKS SPECIFICATION

1.0 GENERAL REQUIREMENTS

This specification is to be read in conjunction with the conditions of contract, and all other specifications and drawings.

Where works are directed to be performed by the Contractor but are not specified in the specification, the Contractor shall carry them out with full diligence and expedition as are expected for works of this nature under the obligations of the Contractor.

2.0 STANDARDS AND CODE OF PRACTICE

Unless otherwise specified herein, the following contemporary Codes and Standards available at the date of the tender shall lay down the minimum standards required for the earthworks. Where these Codes and Standards are in conflict, or are less strict than the equivalent provisions of the Malaysian Standards, the latter standards shall take precedence:

- BS 6031    Code of Practice for Earthworks
- BS 8004    Code of Practice for Foundations
- BS 1337    British Standard Methods of Test for Soil for Civil Engineering

Unless otherwise permitted in the local regulations, the latest Malaysian Standards follow by British Codes and Standards pertaining to the particular type of material being used shall determine the quality of material and the method of work in the Contractor's design and construction of temporary structures.

Where the Codes or Standards do not provide adequate guidelines on any aspect of the construction operations or of temporary structures on the Contractor's design, the Contractor shall be responsible for the observance of proper safety measures and good engineering practices, including prototype testing to verify the design. If inexperienced in erecting the type of temporary structures being provided or in doubt as to the adequacy of its design, the Contractor shall engage suitably qualified competent Professional Engineers with the requisite expertise in these areas to supervise the erection or perform the design of the temporary structures.

3.0 CONTRACTOR'S RESPONSIBILITIES

The Contractor shall allow in his contract price for his compliance with the requirements of this section and for all other things necessary to complete the required earthworks. He shall allow and be responsible for making all necessary temporary works complete and safe for the purpose of the earthworks. In this respect, he shall conduct site investigations, prepare adequate designs, make statutory submissions, construct, test, monitor and subsequently remove all necessary temporary works to the satisfaction of both the Engineer and the local Authority.

The Contractor's method of construction shall comply with the stricter of either the statutory limits imposed on lateral and vertical ground movements, construction noise, vibration and air pollution levels, or such limits necessary for the adequate protection and proper functioning of neighbouring roadways, buildings and their facilities as agreed with the Engineer. The Contractor's compliance with these limits shall not relieve him of his sole responsibility for all consequential damages to adjoining structures, roads and other properties caused by excavation work.

The Contractor shall excavate to the required lines, levels and grades to meet the requirements
of the Works and remove surplus excavated material off the Site. He shall protect the exposed faces of the excavation with approved materials and lay all slope protection in proper and timely sequence to suit his method of construction.

The Contractor shall take all necessary steps before the commencement of earthworks to verify and supplement the soil report and any other information provided at tender, to the extent that is required in his method of construction.

The Contractor shall conduct pre-commencement site visits where necessary to establish and verify the locations and levels of all existing underground utilities within and surrounding the Site that are affected by the earthworks, and take all necessary steps either of a temporary or a permanent nature to protect, divert or shut off the affected services to the satisfaction of the local Authority or service provider. Failure to inspect the site or understanding the conditions shall not relieve the Contractor from its responsibility of performing the work successfully.

The Contractor's Professional Engineer shall, jointly with the Contractor, prepare complete and adequate designs, shop drawings, specifications, method statements, sequence and schedule of placement of all necessary temporary works such as temporary earth retaining structures (if any), drainage and dewatering or groundwater control systems, ground movement monitoring systems, protective hoardings, barricades and signages, etc. to enable the excavation to be safely carried out and maintained with minimal disturbance to neighbouring structures, roads and other properties, all to the acceptance and satisfaction of both the Engineer and the local Authority. The Contractor's Professional Engineer shall be responsible for supervising all temporary construction works to the requirements of his designs and specifications.

All designs, shop drawings, specifications, sequences and schedules of placement of temporary works shall be certified by the Contractor's Professional Engineer. Certified copies of the same shall be extended to the Engineer prior to any site installation. The Contractor shall submit the part or the whole of such certified design, drawings and specifications that is necessary to secure from the local Authority the required clearances and the statutory permit to commence earthworks. In this respect, he shall comply with any other statutory requirements pertaining to temporary works which may be imposed from time to time in the course of the Works.

Where temporary works will cause alterations to the permanent structure, such as changes in the design loadings to accommodate construction loads, provision of temporary construction openings, incorporation of the temporary works or part thereof into the permanent structure etc, the Contractor shall be responsible for providing complete revised designs and details of the affected permanent work which shall be certified by his Professional Engineer. Revised designs of the permanent structure shall comply with the requirements of these specifications and shall be in general conformance with the design concept of the permanent structure, all to the satisfaction of the Engineer.

The Contractor and his Professional Engineer shall supervise the performance of all temporary works and monitor lateral and vertical ground movements, including related parameters such as groundwater table level etc. All performance measurements shall be recorded and made available to the Engineer for his record. The Contractor shall be responsible for and execute in a timely manner all corrective measures made necessary due to either his failure to comply with the specified and/or statutory limits imposed on permissible lateral and vertical ground movements or any other inadequacy in his design and/or construction of the temporary works.

The Contractor shall not deviate from his submitted designs, method statements and construction sequences for the temporary works unless such deviation are approved by his Professional Engineer and agreed with the Engineer. He shall adhere strictly to the use of good workmanship, proven construction techniques and timely implementation of submitted construction sequence to restrict ground loss and movement next to the excavation. The Contractor shall be responsible for all consequent damages caused by his failure to construct in accordance with his submitted designs and method statements or by his failure to adopt adequate safety precautions and to observe good engineering practices in his construction
Upon completion of construction operations, the Contractor shall remove all temporary works to the satisfaction of the Engineer and to the requirement of the local Authority. He shall obtain approved fill material, transport, deposit in voids between the face of the excavation and the permanent structure, and compact to the required lines, levels and grades required for the satisfactory completion of the earthworks. The Contractor may, with the consent of the Engineer, use surplus excavated materials as fill provided the material meets the requirements of these specifications.

### 4.0 LOCAL REGULATIONS

The Contractor shall be responsible for executing the earthworks strictly in accordance with the relevant local regulations and by-laws that are current at the date of the tender together with all amendments and addenda which are imposed as statutory requirements in the course of the Works.

### 5.0 SITE CONDITIONS AND CONSTRAINTS

Prior to the submission of the tender, the Contractor is required and deemed to have visited the Site to fully acquaint himself as to the nature, extent and practicality of the excavation, underpinning works, earthworks or associated temporary works. The Contractor shall satisfy himself that the existing ground and formation levels as shown on the drawings are correct.

The award of the Contract shall be based on the understanding that the Contractor is familiar with the geology of the Site. He shall include in his tender for all costs arising from the nature of the ground (ground levels, water table level, rock formations, subsoil conditions etc), climatic conditions, the availability or lack of access, working space, storage, accommodation, the proximity of adjoining structures and roads, the local Regulations regarding the obstruction of public highways and any other limitations imposed by the Site and its surroundings, for the satisfactory completion of the earthworks. He shall make due allowance for the effect of these constraints on his construction operations to ensure on-time completion of the Works. No claim by the Contractor on the grounds of lack of foresight or knowledge of the site conditions or for under-provision in connection with the Works will be considered.

The Contractor shall ensure that his method of excavation is suitable and safe for use at the Site. The Contractor shall indemnify the Employer against any expense, liability, loss, claim or proceedings which the Employer may incur or sustain by reason of damage to any property, real or personal other than works, injury or accident to workmen or public, caused by collapse, subsidence, vibration, weakening or removal of support or lowering of ground water, arising out of or in the course of or by reason of the execution of the Works.

### 6.0 SITE ACCESS

The Contractor shall be responsible for obtaining all necessary statutory approvals on temporary access into the Site for the tenure of the contract period. He shall comply strictly and diligently with all conditions attached to these approvals. The access as well as the portion of public road and walkway connected with it shall be maintained, kept clean and safe at all times. Continuous and adequate security arrangements at access points into the site shall be provided for the full duration of the contract.

### 7.0 SUBSOIL DATA

A soil investigation report for the Site is available to the Contractor for his information. The report
is intended solely as a preliminary and approximate guide to the nature of ground stratification as it is known to the Engineer. The completeness and the accuracy of the information provided is neither guaranteed nor implied. No responsibility is assumed by the Employer or the Engineer for any opinion or conclusion given in the soil investigation report.

The soil investigation report limits itself to and identifies subsurface conditions only at selected points where soil samples were taken, when they were taken. The actual conditions in areas not sampled may differ from the reported findings. Continuing adequacy of the report may be affected by time, construction operations at or adjacent to the site and by natural events such as floods and ground water fluctuations.

Given the limitations attached to the soil investigation report, the Contractor shall be obliged to place his own interpretation on the information provided and include in his tender for the cost of providing all things necessary to ensure the satisfactory completion and the safety of the earthworks, such as supplemental soil investigation and adding, upgrading, strengthening, adapting, modifying, taking down and refixing of temporary works, etc. He shall assess the limitations of the soil report and make due allowance in his construction operations to ensure the on-time completion of the Works. No extra time or payment will be considered at a later date on the grounds of under-provision in the excavation, earthworks or associated temporary works, incomplete or incorrect information contained in the soil report, or want of knowledge or foresight.

The Contractor shall make his own verification of water table at the Site. No claims will be considered for any special pumping or bailing required related to the work below the water table level. The Contractor shall allow in the tender for the cost of any extra supports to stabilise the earth required to excavate below the water table level.

Details and results of all supplemental soil investigation which the Contractor undertakes in the course of the Works shall be made available to the Engineer for his record.

8.0 SURVEY WORKS

8.1 Topography Survey

Immediately after taking possession of the Site and BEFORE commencing any work on Site, the Contractor shall engage a licensed surveyor to conduct topography survey of the Site. The topography survey shall establish the boundary of the site and reflect the actual topographic condition of the site at the time the survey is being carried out. The topographic survey shall capture but not limited to the followings:

(a) The survey line interval shall generally be 10m or closer for the places of interest such as localised landslip, gullies, streams, rivers, slopes, berms, drainages and etc. Any change of terrain such as a sudden drop of height shall be shown in the survey Drawing. The survey line interval shall generally be 25m for areas outside the places of interest.

(b) Signs of erosion especially gullies > 0.5m depth shall be shown in the survey Drawings. It should include the length, width and depth of gullies.

(c) Stream and river, its direction of flow, width, depth, invert levels and depth of water and etc.

(d) Levels of all existing slopes and berms.

(e) Existing plantation/vegetation such as palm trees, rubber trees, primary forest, secondary forest shall be indicated. The existing plantation shall be identified such as young palm tree, mature palm trees, old rubber trees and etc. The existing vegetation
shall be classified as sparse, bare, dense and etc. Whenever possible, the average height of the plantation such as palm oil, rubber trees or forest shall be measured and included in the drawings.

(f) Existing extent and invert levels of all drainage system (including intact and damaged drains, sumps, culverts and etc). The sizes and types of drain (earth drain, concrete drain and etc) shall be shown clearly. Where a drain comes to an end point, the end point shall be shown together with the invert level.

(g) Existing extent of retaining walls such as RC wall, reinforced soil wall, crib wall, gabion wall and etc. The height and length of all retaining walls shall be captured in the survey. The elevation view of the retaining wall shall also be shown.

(h) The alignment and levels of existing road.

(i) The boundary of the Site with the adjacent lot boundary and lot number.

(j) The coordinates of all Boreholes, Mackintosh Probes, Instrumentation or other investigation works at site.

(k) The locations of all the TBM and survey markers with coordinates and levels.

The topography survey shall be witness by the Engineer’s representative. The survey drawings must be endorsed by a licensed surveyor. The topography survey shall serve as a basis of measurement for the earthwork quantities. Interim survey shall be carried out by the licensed surveyor when the Contractor intends to submit an interim claim. All remeasurement shall be based on theoretical quantity (no bulking factor), specified dimensions and setting out details in the construction drawings.

8.2 Dilapidation Survey

Apart from the topography survey, the Contractor shall also conduct an adequate dilapidation survey with measurements of all principal buildings and permanent facilities around the site boundaries to establish their general pre-construction condition. The survey report shall be lodged with the Employer, the Engineer, the local Authority, the adjacent Owners, and with any other party that the Employer may direct.

For each adjacent building or facility, the Contractor shall prepare a set of photographic records together with proper documentations and a schedule listing the size of the superstructure, extent of underground structure, visible defects with measurement and any other relevant details pertaining to the general condition of that building or facility.

9.0 SITE CLEARING

Site clearing shall consist of clearing, grubbing, stripping topsoil, backfill, dumping and etc. The work shall also include the demolition and disposal of structures as directed by the Engineer.

9.1 Clearing

Clearing shall consist of the cutting, taking down, removal and disposal of everything above ground level, except where such tress, vegetation, structures or etc which are designated to be remain or be removed by others. The clearing material shall include but not limited to trees, stumps (parts above ground), logs, bushes, undergrowth, long grasses, crops, vegetation and structures. Clearing shall also include the levelling of obsolete dikes, terraces, ditches and etc.

9.2 Grubbing
Grubbing shall consist of the removal and disposal of surface vegetation, the bases of stumps, roots, the underground parts of structures, and other obstructions to a depth as least 0.5 metre below ground level.

9.3 **Stripping Topsoil**

Stripping topsoil shall consist of the removal of topsoil to a depth of 150mm below ground level.

9.4 **Backfill**

Holes or cavities are found within the site shall be backfilled with materials similar to the adjacent ground, and such fill shall be compacted to a dry density similar to that of the surrounding material. The backfilling of holes and cavities shall be considered incidental to the work of grubbing and shall not be measured separately for payment.

9.5 **Dumping**

All materials resulted from site clearing shall be dumped to the approved Contractor's dump site, unless otherwise directed by the Engineer. Burning of dumping material at Site is totally prohibited.

10.0 **EXCAVATION**

All excavation shall be carried out to the required lengths, breadths, depths, inclinations and curvatures as required for the construction of the permanent works, in whatever material that may be found.

10.1 **Removal of Unsuitable Material**

Mackintosh Probe (MP) test shall be carried out after site clearing and prior to the earthwork operation. The locations of the MP shall be as directed by the Engineer. The results of the MP shall be submitted to the Engineer and the depth of the unsuitable material shall be determined by the Engineer upon reviewing the MP results.

10.2 **Excavation in Soil**

The Contractor shall be required and is deemed to have visited and examined the Site to ascertain the nature thereof and the kinds of materials to be excavated prior to his submission of the tender. He shall allow in his tender for the cost of excavating all types of soil that he will encounter at the Site, and include a separate provision for excavation in rock as defined hereafter in this specification.

The Contractor shall be solely responsible for:

(a) Implementing an adequate method of excavation, and adhering to safe work sequences and proper standards of workmanship in connection therewith.

(b) Providing adequate protection of all excavations from collapse and subsidence of adjacent ground and properties.

(c) The safety and integrity of the adjacent properties of the permanent works.

If in the opinion of the Engineer the method and sequence of excavation is inadequate in any way, he will reject the excavation proposals. Any such rejection shall not relieve the Contractor of his sole responsibility as defined above, and in such event, the Contractor shall bear the additional cost and time of providing a satisfactory alternative method of excavation to comply with the requirements of these specifications.

The Engineer shall have the right to order excavation and construction work to be carried out in
such lengths and in such sections of the works as in his opinion, will minimise the danger of the excavation affecting the stability of any nearby ground. The Contractor shall have no claim for any extra payment or time on this account.

Wherever necessary for the safety of the workmen and other authorised persons on site, adequate barricades and protective covers shall be provided around all excavations.

Before commencement of earthwork, levels of existing ground as specified by the Engineer are to be verified by the Contractor's licensed surveyor. The survey shall be witnessed by the Engineer's representative. The Contractor shall produce a survey drawing showing existing ground levels for the Engineer's pre-commencement approval.

No excavation in which construction has been completed is to be filled or back-filled before the finished work has been inspected and approved by the Engineer, failing which the Engineer will order the excavation of the fill to expose the permanent work for inspection. The Contractor shall be entirely responsible for the cost and extra time of such additional work and inspection.

In excavations of cuttings for the purpose of forming cut slopes, the Contractor shall be required to commence excavation from the top and work their way down. Under no circumstances is the contractor allowed to facilitate the cutting of slopes by undercutting the toe of the slopes creating a collapse of the soil mass.

10.2.1 Formation Surfaces

The base of all excavations, after being trimmed and levelled, shall be well rammed and compacted to form a solid formation to the approval of the Engineer. It shall be the responsibility of the Contractor to prevent damage to the prepared formation from weathering, trampling by workmen and other construction activities.

For the purpose of this section, sound material shall mean soil with the minimum bearing capacity and coefficient of subgrade modulus that is adequate for supporting the superimposed loading.

The Contractor shall satisfy the Engineer by means of tests that sound materials are founded at the base of excavations. Where tests show otherwise or where the original soils encountered at or below formation level are soft, loose or unstable, the excavation shall be carried down to such depths and over such dimensions as the Engineer will direct until sound materials complying with the requirements of these specifications is reached. The excess excavation shall be made good with approved granular fill and compacted to the satisfaction of the Engineer.

Should the Contractor excavate into original sound material beyond or below the designated lines or levels, or should the Contractor cause the prepared formation to deteriorate and become soft or unstable due to his lack of diligence or expedition or any other cause within his control, he shall at his own expense and as directed by the Engineer, replace such excess excavation and softened formation with approved granular fill. The Contractor shall have no claim for extra time in connection therewith.

The Contractor shall give at least 24 hours notice to the Engineer prior to blinding the surface of the excavation so that an inspection may be made. No blinding or concreting shall be carried out without the approval of the Engineer. The level of all blinded surfaces prior to concreting shall be to the correct levels with a permissible deviation of ± 15 mm. Should the Contractor commence to place concrete without first having satisfied the Engineer, by testing or otherwise, that the base of any excavation is at least of the required bearing capacity and/or having the minimum modulus of subgrade reaction, the Engineer will order the removal of the said concrete and require excavation to continue. The Contractor shall be entirely responsible for the cost and time of such extra work.

10.3 Excavation in Rock
Rock shall comprise material found in ledges or masses in its original position or artificial material, which would normally have to be loosened either by the use of blasting or approved pneumatic tools for their removal. Rock boulders found in general excavation shall constitute as rock if such boulders are of size exceeding one cubic metre.

Notwithstanding the above, rock shall not include material which in the judgement of the Engineer can be loosened with a dozer mounted drawn ripper of the following description:

**Tractor Unit**: Plant with a minimum weight of 25 tonnes and net horsepower rating of 300 h.p. or 225 kw. The tractor unit is to be in good conditions and operated by experienced personnel skilled in the operation of ripping equipment.

**Ripper Unit**: The ripper to be attached to the dozer shall be the most efficient parallelogram type recommended by the tractor or ripper manufacturer. The ripper shall have shanks in good condition with sharpened cutting point.

Shale and clay boulders will not be considered as rock. The Engineer's decision as to whether or not the materials of the excavation is classified as rock shall be final.

The Contractor shall be entitled to extra payment for rock excavation only if reasonable notice is given to the Engineer to examine such material prior to breaking up and measure the extent and depth before further excavation.

### 10.4 Classification of Excavated Materials

Rates for excavation shall include for excavating in whatever type of soil formation that may be encountered, with the exception of rock which in the opinion of the Engineer is not removable by ordinary tools, bars or ordinary earth moving equipment and requires special methods of removal as defined hereafter.

### 10.5 Hard Materials Other than Rock

Materials such as laterite earth, gravel, disintegrated or decomposed masses, geologically semi-formed or weathered “rock” such as very dense cemented sand and other such hard, composite materials that can nevertheless be excavated by standard use of ordinary earth moving machines, shall be deemed as ordinary materials. Excavation of these materials shall be paid for at normal excavation rates.

### 10.6 Handling and Disposal of Excavated Materials

Surplus or rejected excavated material not required for filling is to be transported off the Site to an approved dump site provided by the Contractor. The Contractor is to take all precautions to prevent any spillage or soiling of the public roads during the removal operation, and is to pay all dues in connection therewith.

### 11.0 FILLING

Filling shall be carried out to the lines, levels and grades required to complete the permanent construction. Should the Contractor fill above the designated levels, the Contractor shall remove such excess filling entirely at his own expense.

### 11.1 Material for Filling

In general, fill material shall be well graded suitable fill material unless otherwise approved by the Engineer. Unsuitable fill and hazardous fill shall not be used at any location or part of the site, including landscaped areas. The Contractor shall allow in the tender for the cost of
laboratory tests to determine the optimum moisture content and dry density of the fill material prior to the commencement of filling operations.

Unsuitable fill shall include but not limited to:

(a) cohesive soils having a liquid limit in excess of 90% or plasticity index in excess of 65%
(b) any material containing topsoil, wood, peat or waterlogged substances
(c) any material containing bio-degradable or organic material (more than 5%)
(d) any material containing scrap metal
(e) material from contaminated sites
(f) material which by virtue of its particle size or shape cannot be properly and effectively compacted (e.g. some slate wastes).

Materials that are soft or unsuitable merely because they are too wet or too dry for effective compaction are not to be classified as unsuitable, unless otherwise as defined by the Engineer.

The safety of workmen, ease of placement and compaction are primary considerations when carrying out filling operations in narrow, confined spaces. Under these conditions, only granular soil will be permitted for use as fill material. The Contractor shall take this requirement into account and make due allowance in the tender for the cost of importing granular fill from an approved borrow source, including paying all dues in connection therewith.

The use of excavated materials as fill is subject to compliance with the requirements of the suitable fill material as specified with written approval of the Engineer. Notwithstanding any prior approval given in this regard, the Engineer shall bear the right to reject and order the removal of any excavated material that he considers unsuitable for use as fill. The Contractor shall have no claim for extra time or costs in connection therewith.

11.2 Compaction of Filling

Fill materials shall generally be placed in layers, and uniformly compacted to the satisfaction of the Engineer before the next layer is applied. Loose thickness of each layer shall not be greater than 300mm to 400mm depending on the type of compaction machinery. In confined work spaces, the use of approved type mechanical rammers or compressed air compactors will be permitted.

The compacted fill shall achieve dry density of not less than 90% of the maximum dry density at optimum moisture content as determined in the standard proctor laboratory tests. The top 1.5m fill below the finished level shall be compacted to not less than 95% of maximum dry density based on standard proctor laboratory tests. The Contractor shall when directed by the Engineer carry out compliance field tests to check the degree of compaction attained on Site. Only tests that meet the minimum compaction requirements of this specification will be paid. The Contractor shall have no claim for extra time in connection therewith.

Compaction of each layer shall only be undertaken when at least 75% of the samples taken at a rate of one sample per 500 square metres show a moisture content within the limits of optimum moisture content \( \pm 3\% \) as determined by B.S. 1377 Test No. 13. In the case of dry fill, the moisture content shall be increased by spraying with water from travelling water tanks or by other approved means as the compaction proceeds.

Compaction tests shall be carried out for every 1.0m thick of fill or every 500m\(^3\) whichever is less. The locations for collection of samples for testing shall be submitted to the Engineer for approval prior to carrying out the tests. The Engineer shall have the discretion to change any of the proposed compaction tests locations proposed by the Contractor. Under no circumstances are the numbers of tests to be reduced without the written approval of the Engineer. The Engineer may also from time to time specify additional compaction tests all at the cost of the Contractor.
Results of all compaction tests shall be submitted within 5 days of sample collection, properly labelled and its locations clearly shown in a drawing to the Engineer for review.

Each layer of fill shall be processed as necessary to bring its moisture content to a uniform level throughout the material, suitable for compaction. The optimum moisture content as determined by the laboratory compaction test, shall be used as a guide in determining the proper moisture content at which each soil type shall be compacted. Compaction shall not be carried out when the fill is too dry or too wet to achieve the satisfactory degree of compaction. In the case of dry fill, the moisture content shall be increased by spraying with water from travelling water tanks or by other approved means as the compaction proceeds. In wet fill, material shall be aerated and dried to adjust the moisture content to obtain the required density. Alternatively, the Contractor may replace the suitable material with optimum moisture content at his own cost.

Where the Contractor has failed to obtain sufficient compaction in each layer to the satisfaction of the Engineer, he shall not be allowed to proceed with the next layer without the Engineer's approval, and no claim for time lost or extra time required will be allowed in connection therewith.

Where undue movement occurs in the course of compaction due to soft, unstable foundation conditions under the fill, the area affected shall be excavated to such depths and over such dimensions as directed by the Engineer. The resultant excavation shall be backfilled with suitable and approved materials deposited in layers, each not exceeding 300mm thick in loose form, and compacted as hereinbefore specified, or with suitable compressed air compactors or mechanical rammers where the excavation work is limited. The Contractor shall have no claim on time or cost in connection therewith.

12.0  EXPLOSIVES

12.1  General

Should blasting be allowed, it must be control-blasting and must be carried out with the written permission of the Engineer and with the approval of the appropriate authority. All permits and licenses required in connection with the blasting works are to be obtained by the Contractor prior to execution of the works. The Contractor must inform the Engineer of the steps taken to safeguard the surrounding property and lives. The Contractor must take all responsibility for any damage or annoyance caused by reason of blasting.

12.2  Storage and Handling

The Contractor shall provide proper buildings or magazines in suitable positions for the storage of explosives in manner and quantities to be approved; he shall also be responsible for the prevention of any unauthorised issue or improper use of any explosives brought on the Works, and shall employ only experienced and qualified men to handle explosives for the purpose of the Works.

12.3  Security

The Contractor shall comply with the relevant security regulations dealing with the storage, handling and transport of explosives.

12.4  Blasting

The shots shall be properly loaded and tamped and, where necessary, the Contractor shall use heavy mesh blasting nets. Strictly, no fly-rock is allowed. The ground vibration limit and velocity during blasting must not exceed 50 mm/sec and the sound level limit must not exceed 110 dB. Blasting shall be restricted to such periods as the Engineer may prescribe. If, in the opinion of the Engineer, blasting would be dangerous to persons or property or to any finished work or is
being carried on in a reckless manner, he may prohibit it, and order the rock to be excavated by other means. The use of explosives by the Contractor in large blasts, as in seams, drifts, shafts, pits or large holes, is prohibited unless authorised in writing by the Engineer.

All drilling and blasting shall be done in such manner as to bring the excavation as close as possible to the required cross-section or profile and to disturb as little as possible the material to be left in place. Where blasting works cause excessive damage to the rock and additional strengthening works such as rock bolts, rock dowels, shotcrete and etc are required after blasting works, the Contractor shall bear the full cost of the strengthening works.

Blasting by means of drill holes, tunnels or any other similar method shall be performed at the entire risk and responsibility of the Contractor, who shall have no claim to payment for any extra work occasioned by breakage outside the required cross-section or profile.

Prior to the start of blasting operations, the Contractor, in the presence of the Engineer shall conduct a survey of all structures and services within 120 metres of the site where blasting is proposed and any other structures which the Engineer considers may be affected, in order to determine the existing or pre-blast condition of these structure. Prior to commencing blasting operations, a written report, supported by photographs where necessary, listing any existing defects in the structures and services, is to be submitted to the Engineer.

All blasting works shall be carried out within the hours as approved by local authority.

13.0 PROTECTION OF PUBLIC AND PRIVATE SERVICES

The Contractor shall be responsible for detecting, protecting, upholding, upkeeping and maintaining all existing services such as roadside drains, mains, ducts, water supply pipes, sewers, gas conduits, electrical and telephone cables and the like over and adjacent to the Site during the tenure of the contract, regardless whether or not these services are known to exist at the time of tender. He shall take extra precautions to prevent undermining of foundations to service lines, thereby resulting in damage and interruption of supply, and make good any damage due to any cause within his control at his own expense and time, and pay all consequential costs and charges in connection therewith.

In the event that damage has been done to services due to the Contractor's work or any cause within his control, and should these repairs be carried out by the local Authority, the Contractor shall make a direct reimbursement to the local Authority for the cost and charges for carrying out the repairs, failing which the Employer reserves the right to pay the local Authority direct and deduct the same from any monies due or becoming due to the Contractor.

Any information made available to the Contractor at the time of the tender is indicative and is intended only as an approximate guide for the Contractor's own verification on Site. Immediately after taking possession of the Site and BEFORE commencing work, the Contractor shall establish test holes to confirm the locations and levels of all existing underground utilities within and surrounding the Site that are affected by his excavation works. If the Engineer is of the opinion that the site verification survey of underground services is incomplete or inadequate in any way, he shall order additional confirmatory test holes to be carried out at the Contractor's expense. The Contractor shall immediately notify the Engineer and the local Authority if he should encounter services not known to have been existing at the time of tender.

If it becomes essential in the opinion of the Engineer and the local Authority to temporarily or permanently divert any cable, pipe or other service, the Contractor shall give the necessary notices to the local Authority and arrange for the diversion work to be carried out, regardless whether or not the service to be diverted is known to exist at the time of tender. The cost of the diversion will be paid for by the Employer but it shall be the Contractor's responsibility to coordinate all service diversion works that are carried out during the tenure of the contract period and ensure that such works do not adversely affect the on-time completion of the Works,
14.0 STABILITY, GROUND MOVEMENT AND SETTLEMENT OF ADJACENT PROPERTIES

The Contractor shall be solely responsible for the stability of all adjoining structures and facilities. The method of construction adopted by the Contractor for the execution of the excavation, earthworks and associated temporary works shall be such that public roadways, private access roads, underground utilities, principal buildings and permanent facilities in adjoining properties are adequately protected from the detrimental effects of instability and ground subsidence.

The Contractor shall be required to assess the settlements and ground movements that he anticipates will occur around the site boundaries due to the excavation work. His calculations and assumptions on which these assessments will be made shall form a part of his submission to the local Authority for the purpose of obtaining statutory clearance and securing the permit to commence work. A copy of such calculations and assumptions shall be made available to the Engineer for his record.

14.1 Ground Movement Instrumentation and Monitoring

The Contractor shall allow in his tender for the cost of implementing an adequate ground movement monitoring system complying to the minimum requirements set out in this section. He shall be responsible for installing, measuring, recording and maintaining all necessary surface settlement points, piezometers and inclinometers, including securing the required permits and written consents from the local Authority and the adjacent Owners to have the instrumentation installed. All instrumentation and monitoring methodology or logistics must be submitted to the Engineer for approval prior to installation.

The Contractor shall undertake an initial level survey along and perpendicular to the side boundaries and maintain level checks of surface settlement points at daily intervals, or such intervals as the Engineer may decide, for the duration the excavations are kept open. Surface settlement points shall be laid out at not more than 5m apart, or at such distances as the Engineer may decide. The minimum distance perpendicular to the Site boundaries shall not be less than five times the depth of excavation, or such distances as the Engineer may decide.

The Contractor shall make careful and regular checks on the rate and magnitude of any ground movements or movements of adjoining buildings, permanent facilities and roadways for the tenure of the contract. Records of all movements shall be maintained by the Contractor and submitted to the Engineer not later than two (2) days after measurement, and immediately should movements be such as to endanger the stability of adjoining properties.

14.2 Limits On Ground Movement

The Contractor shall be responsible for restricting the maximum settlement and lateral movement of the ground adjacent to the Site to the lesser of either the statutory limit imposed by the local Authority, measured from the initial pre-construction reference level or line. The Contractor's compliance to this limit shall not relieve him of his sole responsibility to make good at his own cost and in the manner prescribed by the Engineer and the local Authority, all consequential damages to adjoining structures, roads and other properties arising from ground movements caused by excavation work.

15.0 TEMPORARY WORKS

The Contractor shall allow in the tender for the cost of providing the necessary design, statutory submission, construction, testing and monitoring of all temporary works, including the
subsequent removal of all recoverable temporary structures, for the satisfactory completion of the earthworks. He shall be responsible for the overall adequacy and safety of all temporary works.

The scope of temporary construction shall include but not limited to:

(a) Life safety measures such as hoardings, barricades, nettings, signboards, etc.
(b) Ground improvement and/or ground water cutoff systems using jet grout piling, etc.
(c) Ground water recharging systems, surface and groundwater drainage system using surface or subsoil drains, sumps, etc.
(d) All other measures necessary for the safe performance of the temporary works, such as maintaining, adding, upgrading, strengthening, adapting, modifying, re-positioning, taking down and refixing from time to time, etc.

The Contractor shall employ a Professional Engineer to design and supervise the construction of the temporary works. A certified copy of the design calculations and construction drawings for the temporary works shall be made available to the Engineer for the purpose of record. If the Engineer is of the opinion that the provision of temporary support for the excavation is inadequate in any way, the Engineer will order additional supports or remedial works to be provided entirely at the Contractor's own expense with no additional performance time. Such instruction will not relieve the Contractor of his sole responsibility for the sufficient support of the excavation.

The Contractor shall make all necessary statutory submissions in connection with his temporary works, and secure from the local Authority the required clearances and the statutory permit to commence work. He shall comply with the requirements of the local Regulations governing his design and construction of the temporary works, including any statutory requirements that may be imposed from time to time during the tenure of the contract.

15.1 Types of Temporary Construction

The Contractor shall be fully responsible for the type of temporary construction that he adopts to ensure the adequate support of the excavation. He shall bear all consequences in time, costs and damages arising from his failure to adhere to adequate safety procedures, sequences of work and standards of workmanship in connection therewith.

The method of construction of temporary works shall take into account the following considerations:

(a) The geology along the length and depth of the cutting
(b) The water levels, hydrogeology and strata permeabilities along the length and depth
(c) The settlements that will be expected and the anticipated effect on neighbouring structures
(d) The depth of construction required
(e) Any particular difficulties that special plant might meet with respect to access, clearances and working space
(f) Control of heave and instability of the base of excavation
(g) The adequate support of existing utilities affected by the excavation
(h) The operation of heavy equipment, the storage of bulk materials and any other form of surcharge next to excavation
(i) Control of lateral load increase and ground loss induced by water seepage through ground surface cracks behind temporary retaining structures

Due regard shall be given to the ground settlements associated with the type or method of
temporary construction adopted by the Contractor:

(a) Where ground water lowering by pumping will cause soil consolidation and ground loss, the Contractor shall design and install a groundwater recharging system; the Contractor shall ensure the sediment deposits and precipitation of solutionized minerals are controlled to maintain continued efficiency of the recharge system.

(b) Timber ground supports which are non-recoverable shall be treated with approved wood preservative before use.

The minimum precautions to be taken by the Contractor for the particular temporary construction that he has adopted include but are not limited to:

15.1.1 Dewatering

Particular attention shall be given to avoid soil consolidation and ground loss next to the excavation caused by fluctuations in the water table level.

15.1.2 Steel Sheet Piling

The Contractor shall ensure that sheet piles are providing proper support to the sides of excavation under the worst combination of lateral earth pressure and groundwater pressure, including the possibility of the water level rising temporarily to the ground surface due to heavy rainfall.

Particular attention shall be given to ensuring compliance with permitted noise and vibration levels during the installation and removal of sheet piles.

15.1.3 Timbered Excavation

The Contractor shall ensure that the timber is providing proper support to the sides of excavation.

In water-bearing granular soil conditions where water leakage into the excavation will cause significant groundwater drawdown leading to ground loss and/or soil consolidation, particular attention shall be given to the use of a suitable ground water cutoff system such as jet grout piling behind the timbering.

Particular attention shall be given to ensure maximum removal of timber on completion of work, but where timber is likely to be left in place, treated timber to prevent rotting is required.

15.1.4 Trench Cutting

Particular attention shall be given when using trench excavation method to control ground movement during the installation of temporary works for braced excavations in close proximity to principal adjacent structures of facilities. Trench cutting requires the sides of excavation to be cut and braced in a preselected sequence of alternate panels.

15.1.5 Open Cutting

Particular attention shall be given to the stability of side slopes and the prevention of deterioration of the sides of excavation by prolong weathering.

Abrupt changes in soil conditions, such as when a compacted soil layer is underlain by loose soil strata below, will undermine slope stability. Particular attention shall be given to safe work methods and to providing adequate support to the excavation under such conditions.
16.0 STABILITY OF EXCAVATION AND MAINTENANCE OF EARTHWORKS

16.1 Surface and Percolating Water

Surface and percolating water will undermine the stability of the excavation and nearby ground through the process of ground loss, consolidation and/or increase in lateral earth loading. The Contractor shall allow in his tender for the cost of providing adequate measures to maintain the stability of the excavation, including but not limited to:

(a) Carry out adequate slope protection.
(b) Divert surface and percolating water clear of all excavations by means of temporary drains and sumps, and provide a groundwater recharging system and etc if necessary.
(c) Fill up and seal on a daily basis all movement cracks that appear on the surface of adjacent ground and continue until ground movement has ceased.

The Contractor shall be responsible for making good and rectifying any bank slips, erosion of slopes and other forms of ground loss, and any consequential damage to drains, culverts, pipes, utilities etc, occurring in the course of excavation and during the period when the excavation stays open, all at his own expense.

16.2 Protection of Slopes And Banks

All exposed earth slopes shall be protected with approved temporary protection not later than one day after they are cut, and IMMEDIATELY if high water table, poor soil or adverse weather conditions are encountered, prior to the application of permanent protection, ie closed turfing or hydroseeding.

Temporary protection shall not be removed until proper and adequate slope drainage (berm drains, cascade drains and toe drains) and permanent protection (closed turfing or hydroseeding) has been constructed as approved by Engineer.

As earthworks progress, it shall be the responsibility of the Contractor to provide slope protection in a diligent and expeditious manner on completion of each stage of excavation. The Contractor shall on no account deviate from his submitted method or sequence of slope protection unless such deviation has been approved in advance by his Professional Engineer.

16.3 Site Drainage And Dry Conditions

The excavation is at all times to be kept well drained and dry by means of temporary slopes, drains, sumps, etc and by pumping.

As earthworks progress, the Contractor shall provide and maintain temporary concrete drainage channels with cascades for the efficient drainage of the area. These drains shall be cut to a gradient not exceeding 1 in 100. The Contractor shall break up and remove temporary drains after use and make good as directed by the Engineer.

The Contractor shall install a drainage and sump system at the final excavation level. He shall maintain the drainage and sump system for the duration the excavation is kept open.

All temporary drains shall be directed to the nearest water course or to sumps which are pumped out to the roadside drain. The roadside drain shall have an adequately large section so that no mud or water will spill onto the roads or pavements. Only self priming submersible pumps of sufficient capacity such as 'Flygt' pumps or similar equipment are to be used. The pumps shall be of sufficient number and capacity to provide adequate pumping capability in the event of breakdown.

The effluent discharge system shall comply with the requirements of the Jabatan Kerja Raya, the Health Department and other appropriate Authorities. The Contractor shall keep the...
roadside drains in the vicinity of the site are free of silt due to site effluent. He shall provide a desilting basin of adequate size for this purpose and remove silt from the effluent before discharging it into the roadside drain. The Contractor shall obtain all necessary approvals and pay all costs and expenses in connection therewith.

16.4 Anti Malarial Measures

The Contractor shall take all necessary precautions to prevent the breeding of mosquitoes and pay all charges made by the local Authority for anti-malarial measures.

17.0 TURFING

Turfing shall be carried out within seven (7) days after formation of the final slope profile as shown in the Drawings and/or where directed by the Engineer. Otherwise, the Engineer reserves the right to engage external party to carry out the work and deduct the additional cost incurred accordingly from the contract. The type of turf shall be as indicated in the Drawings or other alternative type as approved by the Engineer and shall be free of lallang and essentially free of weeds.

All turfing shall be close turfing. No spot turfing, grid turfing or strip turfing shall be allowed unless otherwise approved by the Engineer.

Turfing works on slopes shall commence immediately upon completion of a single berm for berms with lengths less than 50m. The earthwork Contractor shall not be allowed to proceed with the formation of subsequent berms unless turfing has already commenced for the preceding berms. For berms with lengths in excess of 50m, turfing shall immediately commence once a 50m stretch of berm is formed and ready for turfing works.

17.1 Ground Preparation

Remove from areas to be turfed any brickbats, stones, concrete waste, tins and such like rubbish.

Grub up tree roots, rake up weeds, collect timber waste and remove from site to leave areas clean and ready for turfing. Irregularities and hollows on existing ground shall be levelled and the surface slightly sloped where directed for drainage purposes. The whole area shall be ploughed and raked to a depth of approximately 100mm and buried rubbish and obstacles brought up shall be removed from site. Lumps of soil shall be broken down and reduced to a granular size. Any lumps of hard substance (shale, etc) shall be removed.

17.2 Grass Variety

Turf to be used shall consist basically of creeping cow grass and shall be free from weeds and other tall grass. Other ground-hugging variety of grass not exceeding 20% in the composition of each turf will be acceptable.

17.3 Turf

Turf supplied, unless otherwise specified in the drawings, shall be Axonopus Compressus in sizes of approximately 305mm x 305mm and with attached soil which shall be a minimum thickness of 38mm. Turf shall be inspected and any weeds together with their roots shall be removed before use. Turf shall be properly stacked, covered from strong direct sunlight and copiously watered. Turf shall be laid as soon as possible. All turves shall be freshly cut. Turfed stored on Site for a period more than 48 hours shall not be used without the approval of the Engineer.
17.4 Laying

Turf shall be firmly bedded in freshly prepared topsoil dressing. All turves, unless otherwise directed, to slopes, embankments, etc shall be pegged in place with wooden pegs. Turves to other areas shall be pegged if instructed by the S.O. The wooden pegs shall be of 25mm diameter and 225mm long.

All turfing shall be finished to give a smooth compact surface. Turfing shall be keep pace with spreading of topsoil.

17.5 Watering

Turf shall be copiously watered, spray applied, once daily and twice during dry periods until the roots are firmly established. Thereafter water once in every 3 – 4 days depending on the weather.

17.6 Fertilising

As soon as the turf has started to grow, sulphate of ammonia of established make shall be spread at the rate of 34gms/3m² followed immediately by generous watering by spray.

17.7 Grass Cutting

Grass cutting shall first be carried out approximately two months after planting and thereafter once every month during Defects Liability Period.

Grass cutting shall be carried out by a diesel-operated lawn mower with cutting blades adjusted to not less than 25mm above ground level. When mowing, care shall be exercised to see that the growing roots or shoots are not cut or damaged. Grass cuttings from first cut shall be distributed and left on the grass. Grass cuttings arising from subsequent mowings shall be raked together and removed from site.

17.8 Rolling

Following each grass cutting, the turfed areas shall be rolled with a smooth roller not exceeding 181kg in weight.

17.9 Maintenance

The Contractor shall be responsible for tending the turf until the end of the Defects Liability Period. Any turf that dries and fails to thrive within the period shall be removed and replaced and replaced at no extra cost with similar new turf. All wild grasses shall be weeded out regularly.

18.0 SEEDING

Seeding or hydroseeding shall be carried out as soon as practical on slopes and other areas as shown in the Drawings and/or as directed by the Engineer.

The Contractor shall submit to the Engineer for his consideration and approval, in advance of the proposed work, full details of his proposed method of seeding and hydroseeding. The information submitted shall include, but not necessarily be limited to, a full description of the following aspects of the work:

(a) the penetration of the areas to be seeded or hydroseeded, including if appropriate the amount of topsoil to be used and its method of application;

(b) the details and results of investigations to determine which types of grass or legume are
comparable with the soil in the areas to be seeded;

(c) the types of grass and legume (if any) and strains of seed to be used, and the function, root and growth characteristics of each type;

(d) the rates of application of the grass and legume seeds;

(e) the composition of fertiliser to be used at the time of seeding and its rate of application;

(f) the composition of fertiliser to be used after seeding, the times of application after seeding, and the rates of application;

(g) the type of mulch to be used and its method and rate of application;

(h) the amount of lime or other chemicals (if any) to be applied to improve the soil before, during and/or after seeding;

(i) the type and amounts of binding agents to be applied with the seeds, mulch, fertiliser, etc. as appropriate;

(j) the proportions and methods of preparation of the seeding mix;

(k) the equipment and method to be used in preparing and placing the seeding mix and other materials;

(l) the cultivation and after-care if the seeded areas, including rates and frequencies of watering, fertilising, grass cutting and general maintenance for at least 1 year after seeding;

(m) the time after seeding required for establishing permanent, dense growth of grasses, which will require minimal maintenance;

(n) guarantees of success of the seeding work.

All grass shall be regularly watered until the vegetation is satisfactorily established to the satisfaction of the Engineer. Any dead grass shall be replaced at the Contractor’s own expense.

19.0 BORROW PIT AND DUMP SITE TREATMENT

The contractor shall submit method statement on cutting or filling and turfing at the borrow pit or dump site for approval of the Engineer. After cutting or dumping, all the slopes shall be formed to a stable gradient and close turfed or protected by other approved surface protection method. Provision of drainage, siltation pond and preventive measures of pollution shall also be included in the method statement.
